Loss by forecast day, 21 forecasters on the same late windows (origins after each set's training cutoff). For each unit, the day's CV(RMSE) is the RMSE of that day's 24 hours over the unit's mean load; curves are geometric means over one fixed set of units (all daily errors nonzero), the scale of the primary estimand. Vertical lines: week boundaries. * Preview population. LCL: 21 forecasters on its 710 common late windows. † HKUST, Helsinki: 14 forecasters (no trained baselines), the windows where the ridge is defined. ‡ UNICON: locally fixed external test (frozen 2.1; curves: 2.2), 14 forecasters.
