Error of the energy delivered through each forecast day, 21 forecasters on the same late windows. For each unit and day d, the RMS over the unit's windows of the error of the mean load over days 1..d, divided by the unit's mean load; curves are geometric means over one fixed set of units, the aggregation of figure 9 applied to energy instead of hourly load. Day 31 is the monthly energy error of figure 11. Computed after scoring. * Preview population. LCL: 21 forecasters on its 710 common late windows. † HKUST, Helsinki: 14 forecasters (no trained baselines), the windows where the ridge is defined. ‡ UNICON: locally fixed external test (frozen 2.1; curves: 2.2), 14 forecasters.
