

Rank tests on per-unit RMSE, late windows, 21 forecasters. a: mean ranks over the 1,762 units of the six test populations (Friedman test $p < 1e-300$); the shaded band is the Nemenyi critical difference from ANKYRA's rank, and filled markers differ from ANKYRA in a Holm-corrected Wilcoxon signed-rank test. b: the same paired test per population (bold: test populations). Rank tests weight every unit equally and ignore the size of the differences; the primary estimand is the log RMS ratio of Figure 3.
