

Block attribution on the late windows of the six test populations and the Suzhou park (the windows of Figures 8–11). The three blocks are orthogonal (P1), so a forecast's hourly MSE is the sum of its level, daily-path and within-day MSE. a: the median over units of each block's share (bars: ANKYRA 2.1, 1.x, TimesFM; medians of three shares need not add to 100). b: unit-equal RMS improvement of ANKYRA 2.1 over TimesFM in each block; BDG2 includes the micro-load rule, written after its result was seen. Descriptive, computed after scoring.
