

Unit-equal improvement $100[1 - \exp(r)]$ in hourly RMS, 95% unit-and-month intervals; filled = interval excludes zero, red = ANKYRA worse.
 Above the dashed line: the five baselines given ANKYRA's information set. Below: foundation models and statistical models on load only.

ANKYRA improvement over the model (%)

● Same information · trained

● Same information · zero-shot foundation model

● Load only · zero-shot foundation model

● Load only · statistical

† BDG2 includes the micro-load rule (since 2.0.1), written after the 2.0.0 result was seen: meters reading 0.0002–0.0005 kW are handed to TimesFM. Three of them still dominate the unit means: for ANKYRA against models that do poorly on them, against it versus MSTL. Without the three meters: TiDE +11%, iTransformer-X +12%, GBT-T +9%, Chronos-2-X -2%, TimesFM-X +7%, TimesFM +3%.
